

Prompt for Antigravity

Fix the following layout issues on the PDF viewer page (owner view), and apply the same fixes to the guest shared view:

1. Share dropdown z-index (functional bug, not just visual)

The "Share Document" dropdown is rendering behind the AI Summary panel — its "Revoke Access" button is partially obscured and likely unclickable in that state. This was supposed to already be fixed to render on top of other floating UI (previously requested for the Share dropdown vs. AI Assistant widget) — confirm the z-index value used for this dropdown is actually the highest in the page's stacking context, higher than the AI Summary panel, the floating chat/comment widgets, and any other overlay. Test by opening Share while the AI Summary panel is visible and confirming the full dropdown (including Revoke Access) is fully visible and clickable on top of everything else.

2. Floating widget positioning conflicts with the PDF viewer's scrollbar

The Comments and AI Assistant floating icons (bottom-right) are overlapping or sitting too close to the PDF canvas's vertical scrollbar, making the layout look cramped/off. Adjust the floating widgets' position so they have adequate spacing from the scrollbar

else.

2. Floating widget positioning conflicts with the PDF viewer's scrollbar

The Comments and AI Assistant floating icons (bottom-right) are overlapping or sitting too close to the PDF canvas's vertical scrollbar, making the layout look cramped/off. Adjust the floating widgets' position so they have adequate spacing from the scrollbar — either by increasing their `right` offset so they sit clear of the scrollbar track, or by insetting the PDF canvas container so its scrollbar doesn't extend into the same corner region as the widgets. Ensure this looks correct across different viewport widths, not just one specific screen size.

3. Apply both fixes to the guest shared view as well

Since the guest view (`/shared/[token]`) uses similar layout components, confirm the scrollbar/widget spacing fix is applied there too. (The Share dropdown itself won't appear in guest view since guests can't share, so that part of the fix is owner-view-only — but double check the same z-index/stacking approach is used consistently across both views' shared components, like the AI Summary panel and floating widgets, so future dropdowns/modals in guest view don't hit the same z-index issue.)

After fixing, verify: open Share on the owner view with AI Summary visible, confirm the whole dropdown including Revoke Access is on top and clickable; check the widget/scrollbar spacing on both owner and guest views at a couple of different window widths.
